## Product Preview **FNB35060T6S**

### Description

FNB35060T6S is an advanced Motion SPM 3 module providing a fully-featured, high-performance inverter output stage for AC Induction, BLDC, and PMSM motors. These modules integrate optimized gate drive of the built-in IGBTs to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts, over-current shutdown, thermal monitoring of drive IC, and fault reporting. The built-in, high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal IGBTs. Separate negative IGBT terminals are available for each phase to support the widest variety of control algorithms.

### Features

- 600 V – 50 A 3-Phase IGBT Inverter with Integral Gate Drivers and Protection
- Low-Loss, Short-Circuit Rated IGBTs
- Very Low Thermal Resistance using AlN DBC Substrate
- Built-In Bootstrap Diodes and Dedicated Vs Pins Simplify PCB Layout
- Separate Open-Emitter Pins from Low-Side IGBTs for Three-Phase Current Sensing
- Single-Grounded Power Supply
- LVIC Temperature-Sensing Built-In for Temperature Monitoring
- Isolation Rating: 2500 V<sub>rms</sub> / 1 min.
- These Device is Halogen Free and is RoHS Compliant

### Applications

- Motion Control – Home Appliance / Industrial Motor

## Integrated Power Functions

- 600 V – 50 A IGBT inverter for three-phase DC / AC power conversion (Please refer to Figure 2)

## Integrated Drive, Protection and System Control Functions

- For Inverter High-Side IGBTs:  
gate drive circuit, high-voltage isolated high-speed level shifting control circuit Under-Voltage Lock-Out Protection (UVLO)

NOTE: Available bootstrap circuit example is given in Figures 4 and 14

- For Inverter Low-side IGBTs:  
gate drive circuit, Short-Circuit Protection (SCP) control supply circuit Under-Voltage Lock-Out Protection (UVLO)
- Fault Signaling:  
corresponding to UVLO (low-side supply) and SC faults
- Input Interface:  
active-HIGH interface, works with 3.3 / 5 V logic, Schmitt-trigger input

### THERMAL RESISTANCE

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
R <sub>th(j-c)Q</sub>	Junction to Case Thermal Resistance (Note 5)	Inverter IGBT part (per 1 / 6 module)	–	–	0.34	°C/W
R <sub>th(j-c)F</sub>		Inverter FWD part (per 1 / 6 module)	–	–	0.93	°C/W

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

4. These values had been made an acquisition by the calculation considered to design factor.

5. For the measurement point of case temperature (T<sub>C</sub>), please refer to Figure 1.

Figure 9. Mounting Screws Torque Order

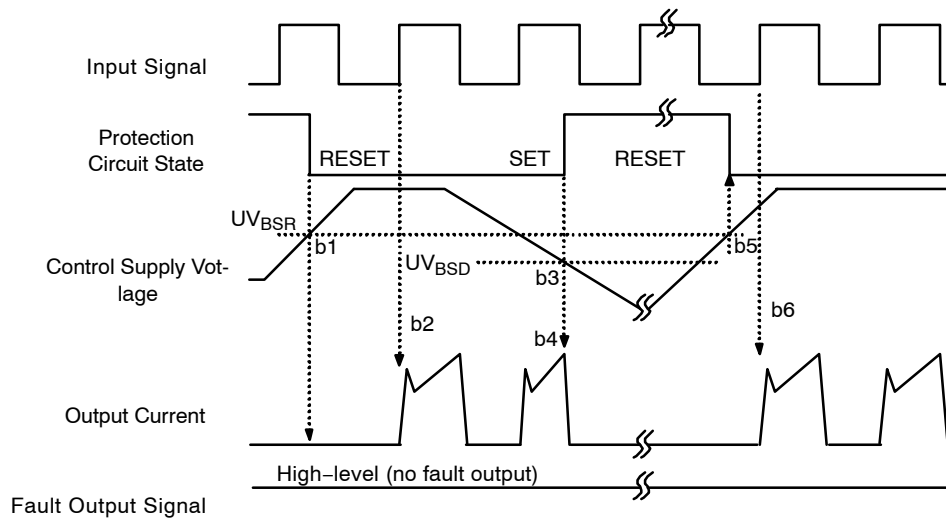

11. Do not make over torque when mounting screws. Much mounting torque may cause DBC cracks, as well as bolts and Al heat-sink destruction.
12. Avoid one-sided tightening stress. Figure 9 shows the recommended torque order for mounting screws. Uneven mounting can cause the DBC substrate of package to be damaged. The pre-screwing torque is set to 20 ~ 30% of maximum torque rating.

### Input/Output Interface Circuit

**Figure 13. Recommended CPU I/O Interface Circuit**

13. RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The input signal section of the Motion SPM 3 product integrates 5 kΩ (typ.) pull-down resistor. Therefore, when using an external filtering resistor, please pay attention to the signal voltage drop at input terminal.

# FNB35060T6S

Figure 14. Typical Application Circuit

14. To avoid malfunction, the wiring of each input should be as short as possible. (less than 2–3 cm)
15.  $V_{FO}$  output is open-drain type. This signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes  $I_{FO}$  up to 2 mA. Please refer to Figure 13.
16. Input signal is active-HIGH type. There is a 5 k $\Omega$  resistor inside the IC to pull-down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation.  $R_1C_1$  time constant should be selected in the range 50 ~ 150 ns. (Recommended  $R_1 = 100 \Omega$ ,  $C_1 = 1 \text{ nF}$ )
17. Each wiring pattern inductance of A point should be minimized (Recommend less than 10 nH). Use the shunt resistor  $R_4$  of surface mounted (SMD) type to reduce wiring inductance. To prevent malfunction, wiring of point E should be connected to the terminal of the shunt resistor  $R_4$  as close as possible.
18. To prevent errors of the protection function, the wiring of B, C, and D point should be as short as possible.
19. In the short-circuit protection circuit, please select the  $R_6C_6$  time constant in the range 1.5 ~ 2  $\mu\text{s}$ . Do enough evaluation on the real system because short-circuit protection time may vary wiring pattern layout and value of the  $R_6C_6$  time constant.
20. Each capacitor should be mounted as close to the pins of the Motion SPM 3 product as possible.
21. To prevent surge destruction, the wiring between the smoothing capacitor  $C_7$  and the P & GND pins should be as short as possible. The use of a high-frequency non-inductive capacitor of around 0.1 ~ 0.22  $\mu\text{F}$  between the P & GND pins is recommended.
22. Relays are used at almost every systems of electrical equipments at industrial application. In these cases, there should be sufficient distance between the CPU and the relays.
23. The zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (Recommended zener diode is 22 V / 1 W, which has the lower zener impedance characteristic than about 15  $\Omega$ ).
24.  $C_2$  of around 7 times larger than bootstrap capacitor  $C_3$  is recommended.
25. Please choose the electrolytic capacitor with good temperature characteristic in  $C_3$ . Also, choose 0.1 ~ 0.2  $\mu\text{F}$  R-category ceramic capacitors with good temperature and frequency characteristics in  $C_4$ .
